```python
# Q3.
def f1(thing: list) -> None:
    thing = ['x', 1] + thing
#            id100      id17
if __name__ == '__main__':
    phone = [9]
    f1(phone)
    print(phone)
```

id17

Here, we assign a new value to thing. Net effect after returning from the function? Nothing!
